

Coral Gardeners

The association Coral Gardeners was created in 2017 by Titouan when he was only 16. Their goal is simple, save the corals reefs by replanting corals.

They grow healthy corals in underwater nurseries. When the coral is strong enough, they plant it back into the ocean to help damaged reefs to grow again. They want to plant one million corals in 2025.

The coral reef is super important for the world but also for the ocean and the fish. They bring oxygen and take care of many different fish.

The causes of the coral's death are petrol, human activity...

Today we went into the water to see the nurseries and we learnt about the daily missions of the people who work at the Coral Gardeners (wash the ropes of the nurseries with a brush, replanting corals ...)

I really enjoyed swimming into the water to see the nurseries, and the discussion with the intern.

The reef is essential to the underwater life, so be careful and try not to pollute by not throwing waste in the ocean or not taking the boat too often.
