

Protecting Our Ocean (Tamatoa CONQUERE DE MONBRISON 3°Mars)

On May 6th 2025, me and my class went to Moorea to visit the Coral Gardeners.

The Coral Gardeners save and help corals by cleaning them and removing harmful algae or by placing them in their environment or even by protecting them from predators such as parrotfish and taramea. (Both eat corals)

The threats of the coral reefs are global warming which attacks corals with the temperature change, plastic or even fish like taramea and parrotfish.

We did some quiz where we had to relate fish to their environment and we went into the water to see what algae attacks them or how they grow up or even how to plant them.

I really liked when we went into the water to see thé corals, It was interesting to see how they plant corals and how they grow up. The Coral Gardeners were nice and fun, they were enjoying teaching us their work.

I learned how important corals and coral reefs are for the planet by protecting us, by protecting the fish because without them some islands or cities would be flooded.
